

How to measure the corner radius of your hot tub

Using a carpenter's square:

the radius is the distance from where the square first touches the hot tub before curving

Note: You might consider specifying a slightly smaller radius. A smaller radius, due to the change in curve, will extend the cover out further past the corner of your spa. 1/2" less radius extends the cover 1/4" further

If you don't have a square handy:

Use pieces of wood, cardboard or anything with a straight edge.

measure the distance for the radius with ruler or tape measure
